

Brent Mennen
Mid Project Update

My project is off to a slow start and there is a ton to do still. I jumped in and attempted to take on learning Spring and Angular without any background in those frameworks. Starting off that caused me to be intimidated to write out my first line of code. I started off with just reading as much as possible about the Spring framework as i could, but I now know that it is best to just jump in and start breaking things and making mistakes.

I have a shell of a very basic CRUD application right now. I built it based off an online tutorial that I found (<https://www.youtube.com/watch?v=TcP5kFPq354&t=37s>) It was a good guide on the basics of getting started. I am now in the process of going through and customizing everything to my project. Still, figuring out the new framework is causing me to move very slowly through everything. I may be in over my head, but I plan to keep chipping away at one thing at a time.

Right now my focus is going to be on getting the basic Spring backend setup with my controllers to allow you to create the data needed. Then I will implement everything with AWS and get that portion of the project setup. After that I think the best thing to work on would be the API. Then I will need to setup the user login information and facebook integration. I also need to integrate with the Alpha Advantage api to bring in up to date stock data.

Now that I wrote that out I realize that I may run into a lot of issues with getting everything working on time. I'll keep at it though and hopefully end up with something quality to turn in.
